DETAILED ACTION

Allowable Subject Matter

1. Claims 1-37 are allowed. Independent Claims 1, 10-11, 20, and 29 each either recite a radio apparatus, or a method of using said radio apparatus, said radio apparatus comprising a transmission circuit, a receiving circuit, a reference signal generator, switching means, and arithmetic means for calculating the difference between the phase and amplitude of a signal that passes through both the transmission and receiving circuits and the phase and amplitude of a signal that originates in the reference signal generator and passes through the receiving circuit. References were found that pertain to the calibration of radio devices, said radio devices including one or more antenna as well as transmitting and receiving circuitry, via phase and amplitude measurements (Parish *et. al.*, Lovelance *et. al.*, and Yun), but no reference was found that discloses the calibration of a radio device via the subtraction of the phase shift and amplitude fluctuation quantities associated with a signal that originates in a reference signal generator and passes through the receiving circuit and terminates in the controller, from the respective phase shift and amplitude fluctuation quantities associated with a signal that originates in the controller and passes through both the transmission and receiving circuits and terminates in said controller. Since Claims 2-9, 12-19, 21-29, and 30-37 depend on the aforementioned Claims, they are allowable over the prior art as well.
